

The Unix Command Line

Command Line Techniques and Directory Navigation

useful commands

- `~` - indicates the root folder
- `pwd` - print working directory - prints entire path of current location
- `ls` - list
- `cd` - change directory (cd and type the directory. type half way through hit tab) -> can jump one or many directories at once
- `cd ~` - got back to root directory
- `cd ..` - takes back one level
- hold `alt` and click - if wanted to move the cursor to middle while typing
- `ctrl + A` - goes to the beginning of the line
- `ctrl + E` - goes to the end of the line
- `ctrl + U` - clears current command without executing it
- `mkdir "directory name"` - creates a new directory
- `touch Text.txt` - creates a file "Text.txt" in the current directory
- `open Text.txt` - opens Text.txt

- `open -a Atom Text.txt` - open the file in a different application. for ex: open Text.txt in Atom
- `rm Text.txt` - remove a file in the folder
- `rm *` - remove all files in the current directory
- `rm -r Oshi/` - removes sthe directory / folder called Oshi
- `atom .` - open folder in atom
